

1. Solve each system (if possible). State the solution VERY clearly. You may use a calculator to put each augmented matrix in RREF.

a. 
$$\begin{cases} 2x + 3y - 3z = 2 \\ 3x - y + 4z = 4 \\ x - 5y + z = 4 \\ 4x + 6y - 3z = 5 \end{cases}$$

$$\left[ \begin{array}{ccc|c} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 \end{array} \right]$$

no solution

b. 
$$\begin{cases} 2x + 3y - 3z = 2 \\ 3x - y + 4z = 4 \\ 7x + 5y - 2z = 5 \end{cases}$$

$$\left[ \begin{array}{ccc|c} 1 & 0 & \frac{9}{11} & 0 \\ 0 & 1 & -\frac{17}{11} & 0 \\ 0 & 0 & 0 & 1 \end{array} \right]$$

no solution

$$\left[ \begin{array}{cccc|c} 6 & 9 & 15 & 7 & 6 \\ 7 & 1 & & & 7 \\ 6 & 6 & 0 & 4 & 4 \\ 5 & 9 & 8 & & 4 \\ 4 & 6 & 7 & & 3 \\ 3 & 6 & & & 6 \end{array} \right]$$

2. If possible, find a so that:  $\begin{bmatrix} 3 & 2 \\ 1 & 1 \end{bmatrix} \begin{bmatrix} a & 6 \\ 6 & a \end{bmatrix} = \begin{bmatrix} 3 & 12 \\ 3 & 3 \end{bmatrix}$ . Show your work.

$$\begin{aligned} 3a + 12 &= 3 & 18 + 2a &= 12 \\ a &= -3 & a &= -3 \\ a + 6 &= 3 & 6 + a &= 3 \\ a &= -3 & a &= -3 \end{aligned}$$

$a = -3$

3. Find all values of the scalar a for which matrix  $\begin{bmatrix} 1 & 2 & 3 \\ a & 5 & 0 \\ 5 & a & 0 \end{bmatrix}$  is not invertible.

$$\begin{vmatrix} 1 & 2 & 3 \\ a & 5 & 0 \\ 5 & a & 0 \end{vmatrix} = 0 \rightarrow 3 \begin{vmatrix} a & 5 \\ 5 & a \end{vmatrix} = 0$$

$$3(a^2 - 25) = 0 \rightarrow a = \pm 5$$

4. Assume  $A, B, C, D$  are  $n \times n$  matrices, and  $A$  is invertible. Solve the following matrix equation for  $C$ , using steps appropriate for matrices:

$$ACA + B = D$$

$$ACA = D - B$$

$$CA = A^{-1}(D - B)$$

$$C = A^{-1}(D - B)A^{-1}$$

5. Let  $A$  be an invertible matrix and let  $k =$  any nonzero scalar.

Prove that the matrix  $kA$  is invertible and that  $(kA)^{-1} = \frac{1}{k}A^{-1}$ .

$$(kA) \left( \frac{1}{k}A^{-1} \right) = k \left( \frac{1}{k} \right) AA^{-1} = 1 \cdot I = I$$

$$\left( \frac{1}{k}A^{-1} \right) (kA) = \frac{1}{k} \cdot k A^{-1}A = 1 \cdot I = I$$

6. Determine if the set of all  $3 \times 1$  vectors is a vector space under the standard operation

of addition, and with scalar multiplication defined as follows:  $k \begin{bmatrix} a \\ b \\ c \end{bmatrix} = \begin{bmatrix} 2ka \\ 2kb \\ 2kc \end{bmatrix}$ . Justify

your answer either by showing at least one axiom that fails and how it fails or else by showing the zero and additive inverse vectors.

axiom b fails:  $1 \begin{bmatrix} a \\ b \\ c \end{bmatrix} = \begin{bmatrix} 2a \\ 2b \\ 2c \end{bmatrix} \neq \begin{bmatrix} a \\ b \\ c \end{bmatrix}$

7. Is the set of all lower triangular matrices a *subspace* of  $M_{n \times n}$ ? Justify your answer.

① Sum of lower triangular matrices is lower triangular (Prop 1.12.1)

② If  $A$  is lower triangular, then so is  $L \cdot A$  since  $L \cdot 0 = 0$  so all the zeros will remain as 0's

So **yes**

8. Let the matrix  $\begin{bmatrix} a & b \\ c & d \end{bmatrix}$  be an element of the subspace of  $M_{2 \times 2}$  spanned by the set of matrices  $\left\{ \begin{bmatrix} 1 & 0 \\ 0 & 4 \end{bmatrix}, \begin{bmatrix} 2 & 0 \\ 0 & 8 \end{bmatrix} \right\}$ . What are the conditions necessary for  $a, b, c, d$ ?

$$\left[ \begin{array}{cc|c} 1 & 2 & a \\ 0 & 0 & b \\ 0 & 0 & c \\ 4 & 8 & d \end{array} \right] \rightarrow \left[ \begin{array}{cc|c} 1 & 2 & a \\ 0 & 0 & b \\ 0 & 0 & c \\ 0 & 0 & d-4a \end{array} \right]$$

You need :  $b = c = 0$  and  
 $d = 4a$

$$\text{Let } c_1 \begin{pmatrix} 12 \\ 34 \end{pmatrix} + c_2 \begin{pmatrix} 56 \\ 78 \end{pmatrix} + c_3 \begin{pmatrix} 12 \\ 10 \end{pmatrix} = \begin{pmatrix} 0 & 0 \\ 0 & 0 \end{pmatrix}$$

9. Are the matrices  $\left\{ \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}, \begin{bmatrix} 5 & 6 \\ 7 & 8 \end{bmatrix}, \begin{bmatrix} 3 & 2 \\ 1 & 0 \end{bmatrix} \right\}$  linearly independent?

Explain, using the definition of linear independence.

$$\left[ \begin{array}{ccc|c} 1 & 5 & 3 & 0 \\ 2 & 6 & 2 & 0 \\ 3 & 7 & 1 & 0 \\ 4 & 8 & 0 & 0 \end{array} \right] \rightarrow \left[ \begin{array}{ccc|c} 1 & 0 & -2 & 0 \\ 0 & 1 & 1 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{array} \right]$$

since this equation has nontrivial

$$\text{solutions: } c_1 = 2c_3$$

$$c_2 = -c_3$$

The matrices are not l.i.

10. Can the matrices  $\left\{ \begin{bmatrix} 1 & 0 \\ 2 & 3 \end{bmatrix}, \begin{bmatrix} 1 & 3 \\ 1 & 0 \end{bmatrix}, \begin{bmatrix} 0 & 1 \\ 3 & 0 \end{bmatrix} \right\}$  form a basis for the set of  $2 \times 2$

~~square~~ matrices? Explain, using the definition of basis.

No. They are l.i. but do not span  $M_{2 \times 2}$ .

$$\left[ \begin{array}{ccc|c} 1 & 1 & 0 & a \\ 0 & 3 & 1 & b \\ 2 & 1 & 3 & c \\ 3 & 0 & 0 & d \end{array} \right] \rightarrow \left[ \begin{array}{ccc|c} 1 & 1 & 0 & a \\ 0 & 3 & 1 & b \\ 0 & -1 & 3 & c-2a \\ 0 & -3 & 0 & d-3a \end{array} \right] \rightarrow \left[ \begin{array}{ccc|c} 1 & 1 & 0 & a \\ 0 & 1 & \frac{1}{3} & \frac{b}{3} \\ 0 & 0 & \frac{10}{3} & c-2a+\frac{b}{3} \\ 0 & 0 & 1 & d-3a+b \end{array} \right]$$

$$\rightarrow \left[ \begin{array}{ccc|c} 1 & 1 & 0 & a \\ 0 & 1 & \frac{1}{3} & \frac{b}{3} \\ 0 & 0 & 1 & d-3a+b \\ 0 & 0 & 0 & (c-2a+\frac{b}{3}) - \frac{10}{3}(d-3a+b) \end{array} \right]$$

so matrices where

$$-\frac{10}{3}(c-2a+\frac{b}{3}) + (c-2a+\frac{b}{3}) \neq 0$$

are not in the span of the given matrices
